

MVC

MANAGED VOICE CONTINUITY

PRODUCT GUIDE

WHAT IS MANAGED VOICE CONTINUITY (MVC)?

MVC leverages the value of an existing non-CallTower data circuit by automatically switching the voice traffic from a downed circuit to an alternate internet data line - In other words, if a CallTower MPLS circuit goes down MVC will failover to the customer's circuit with minimal interruption in service.

MVC OFFERS ADDED BENEFITS SUCH AS:

Greater peace of mind

Cost savings for small businesses

Protection against network disruptions with immediate and dynamic failover

No customer intervention needed

Continuity of business-critical voice applications

Ability to failover to any internet connection – DSL, cable, wireless
